

A decorative graphic on a blue background. It features a central white rounded rectangle containing the text. To the left of the rectangle is a large orange circle, and below it is a smaller green circle. To the right of the rectangle is a green circle above a larger blue circle. A white outline of a circle is positioned above the rectangle. All circles are connected to the central area by thin white lines.

Search for DPDM with Tunable SRF Cavities

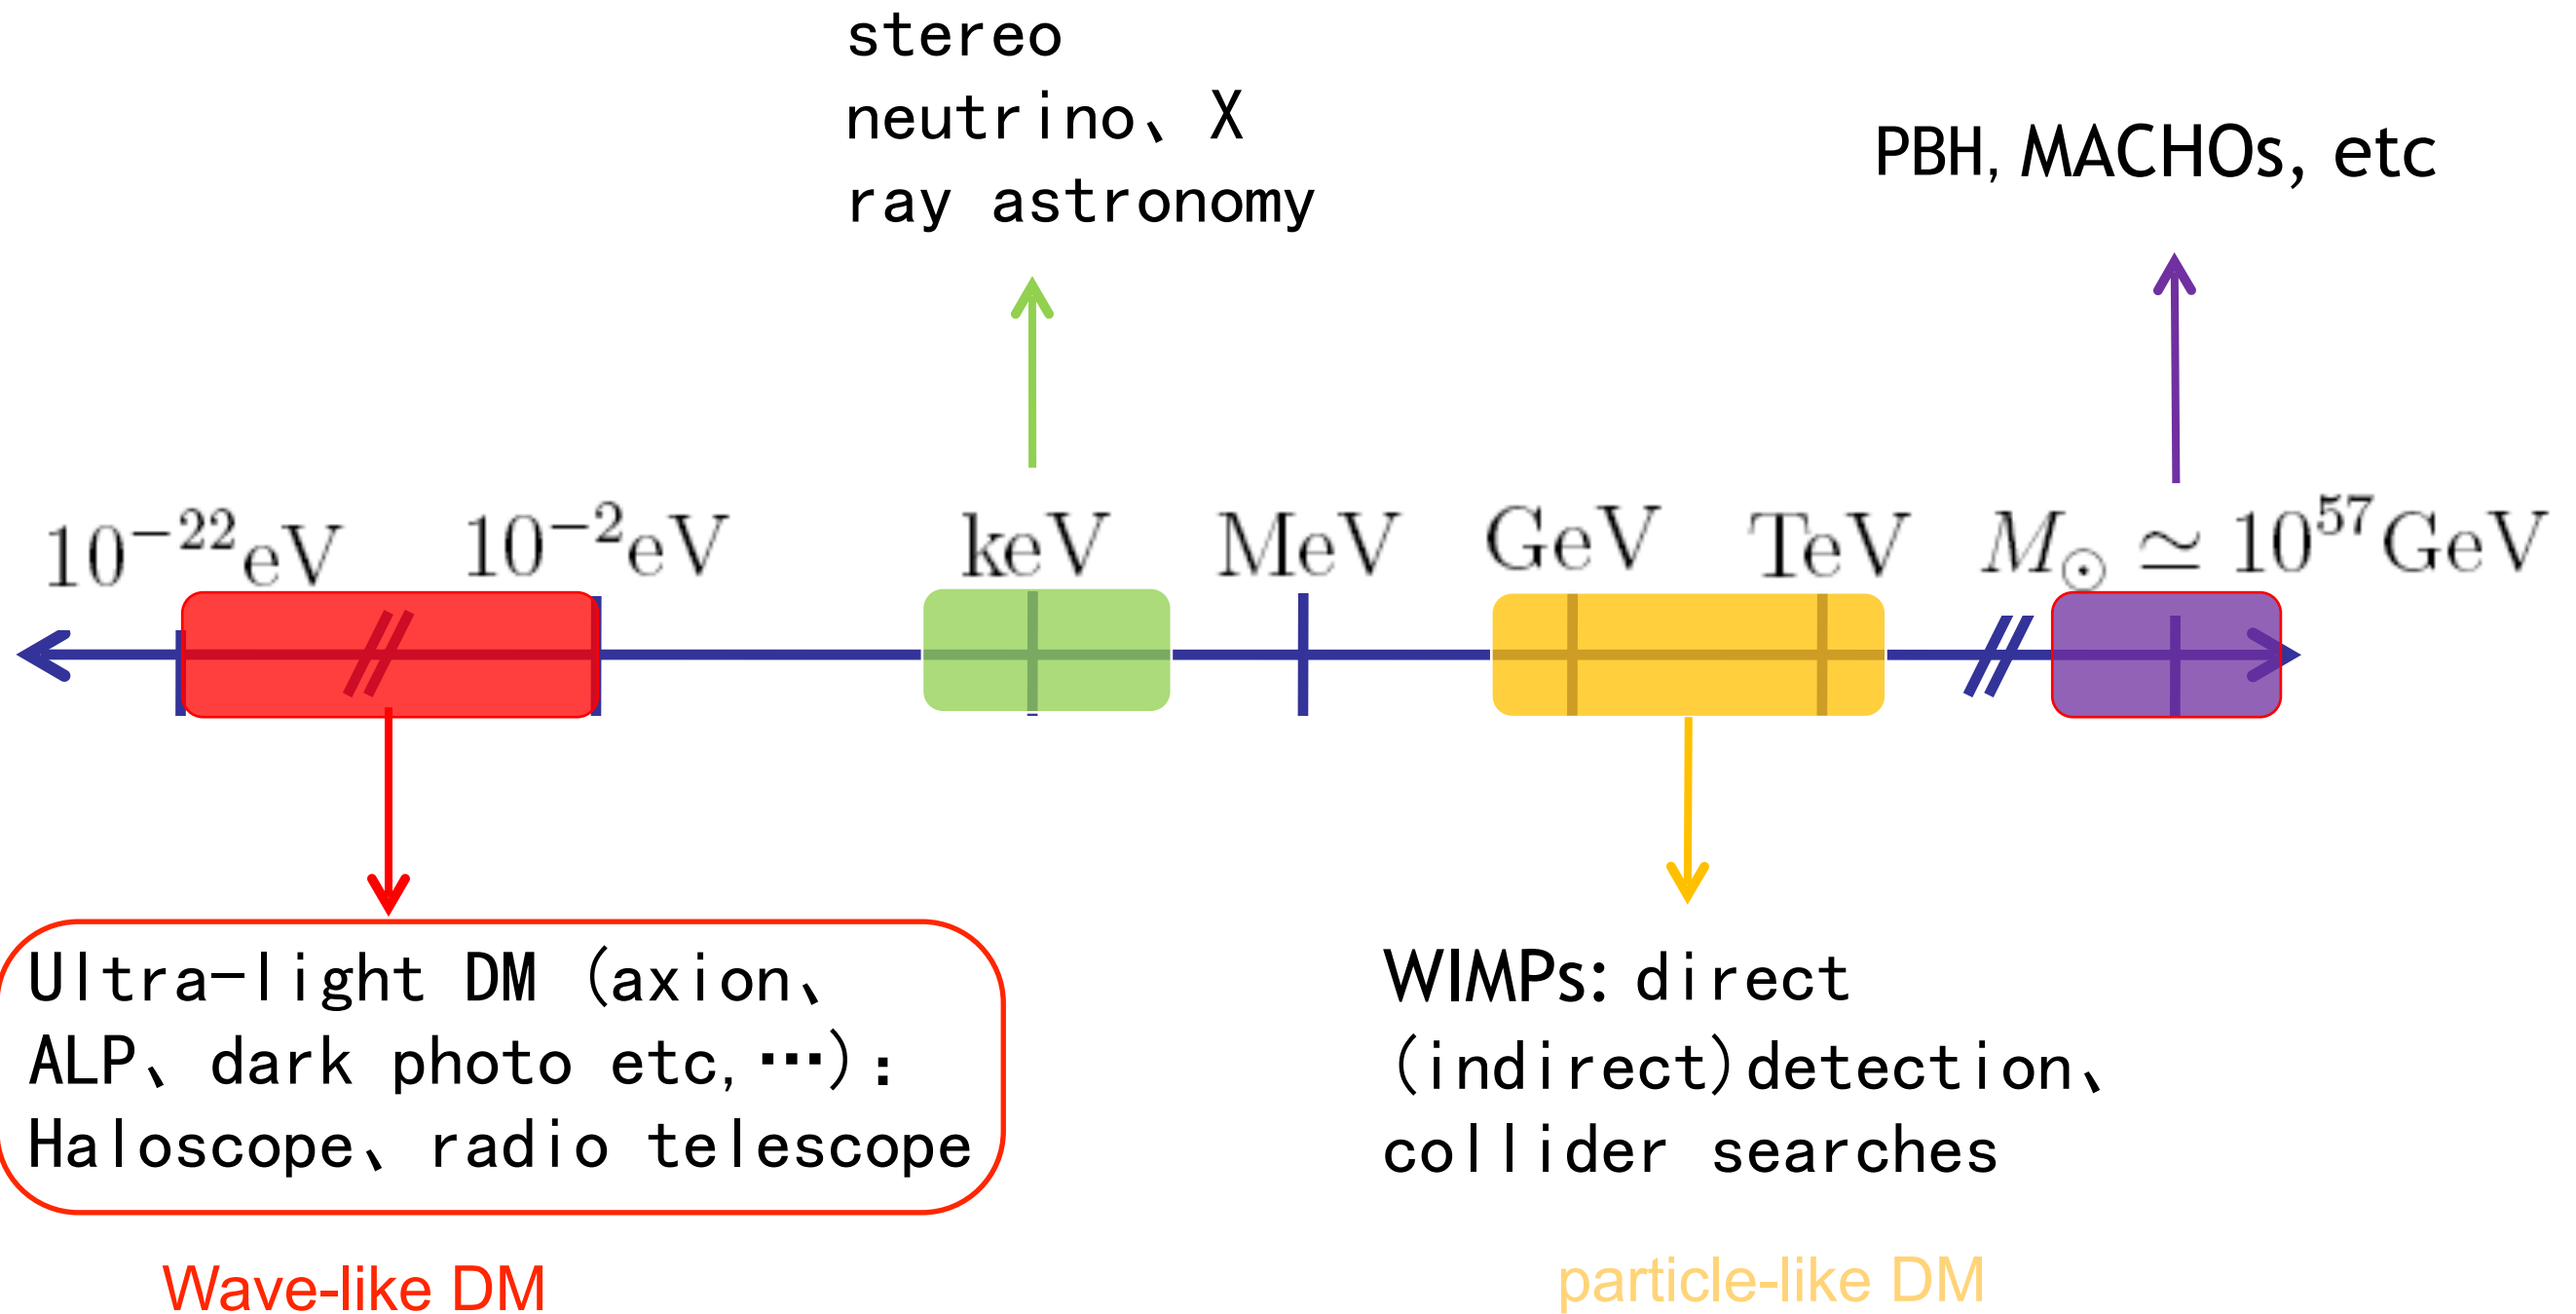

Outline

- Motivation of ultra-light dark matter search using Superconducting Radio Frequency (SRF) Cavity
- SRF Cavity Project for DPDM search
- SRF Cavity Project for cosmic DP? (preliminary)
- Experimental group
- Summary and Outlook

A decorative graphic on a blue background. It features a central white rounded rectangle containing the text. To the left, there is a large orange circle, a smaller white circle, and a green circle. To the right, there is a green circle and a large blue circle. All circles are connected to the central text box by thin white lines.

Motivation of ultra- light dark matter

Various DM candidate

There's a broad spectrum of possible particles with varied masses and interaction strengths, making experimental searches challenging.

The ultra-light DM

QM: All matter exhibits both particle and wave properties.

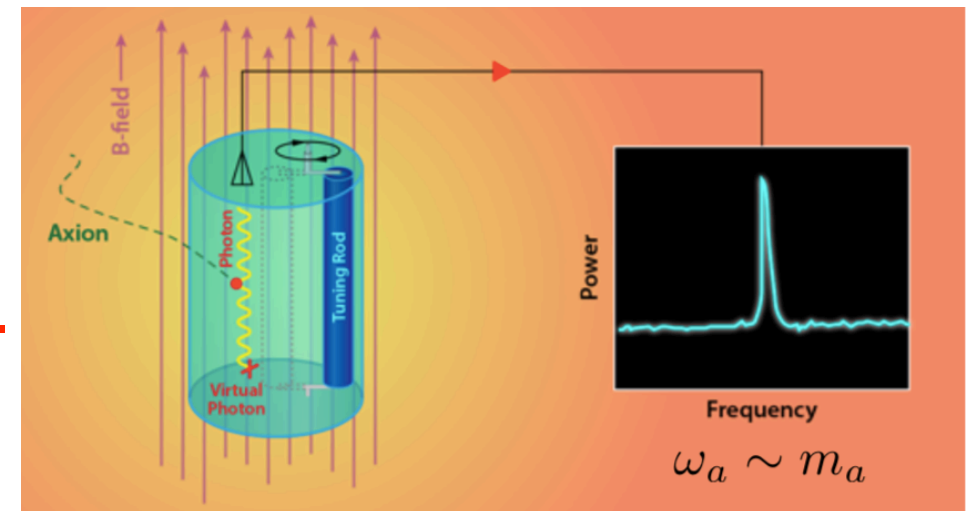

$(m \sim 10^{-22} \text{ eV})$

The de Broglie wavelength:
galactic scales (kpc)

- Astronomical observation
(time, position, velocity,
polarization, etc)

Wavelengths at
macroscopic scales,
manifesting as a wave-
like background field

$$m_a \sim \text{GHz} \sim 10^{-6} \text{ eV}$$

Distinct from traditional
dark matter detection
(particle scattering)

enormous potential for
development in this field

similar as the GWs detection

Compton wave length (m)

Haloscope, Quantum
amplifier

New search methods!!!

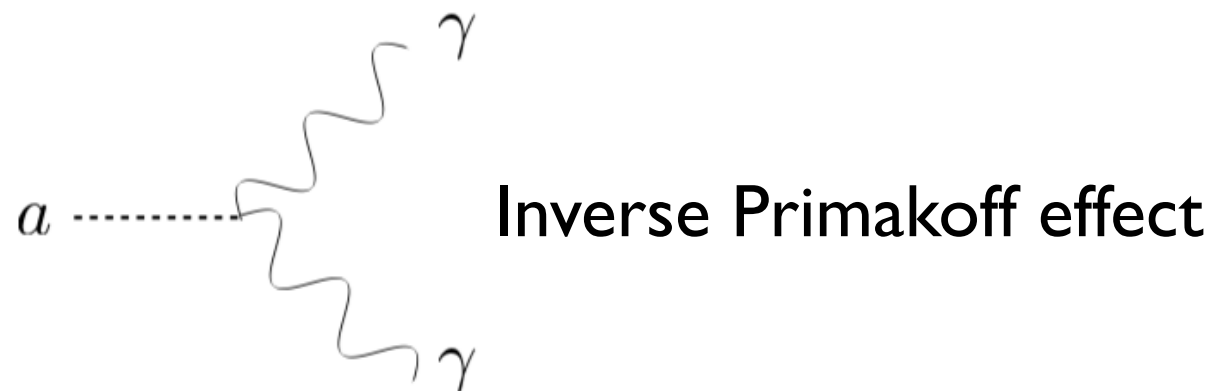

Quantum sensor

Ultra-light DM candidate

Axion (ALP): spin 0, CP odd

Dark photon: spin 1

mili-charge particles?

$$\nabla \times \mathbf{B} \simeq \partial_t \mathbf{E} + \mathbf{J} + \underline{g_{a\gamma\gamma} \mathbf{B} \partial_t a}$$

induces an effective current under strong **magnetic field**.

$$\vec{J}_{\text{eff}}^a = g_{a\gamma} \omega_a a \vec{B}_0.$$

$$\square \mathcal{L} \supset -\tilde{A}_\mu (eJ_{EM}^\mu - \epsilon m_{A'}^2 \tilde{A}'^\mu)$$

induces an effective current **anyway**.

$$J_{\text{eff}}^{A'\mu} = \epsilon m_{A'}^2 A'^\mu;$$

Current DPDM search

Haloscope sensitivity largely depends on Q:
 Superconducting cavity has $Q \sim 10^{10}$

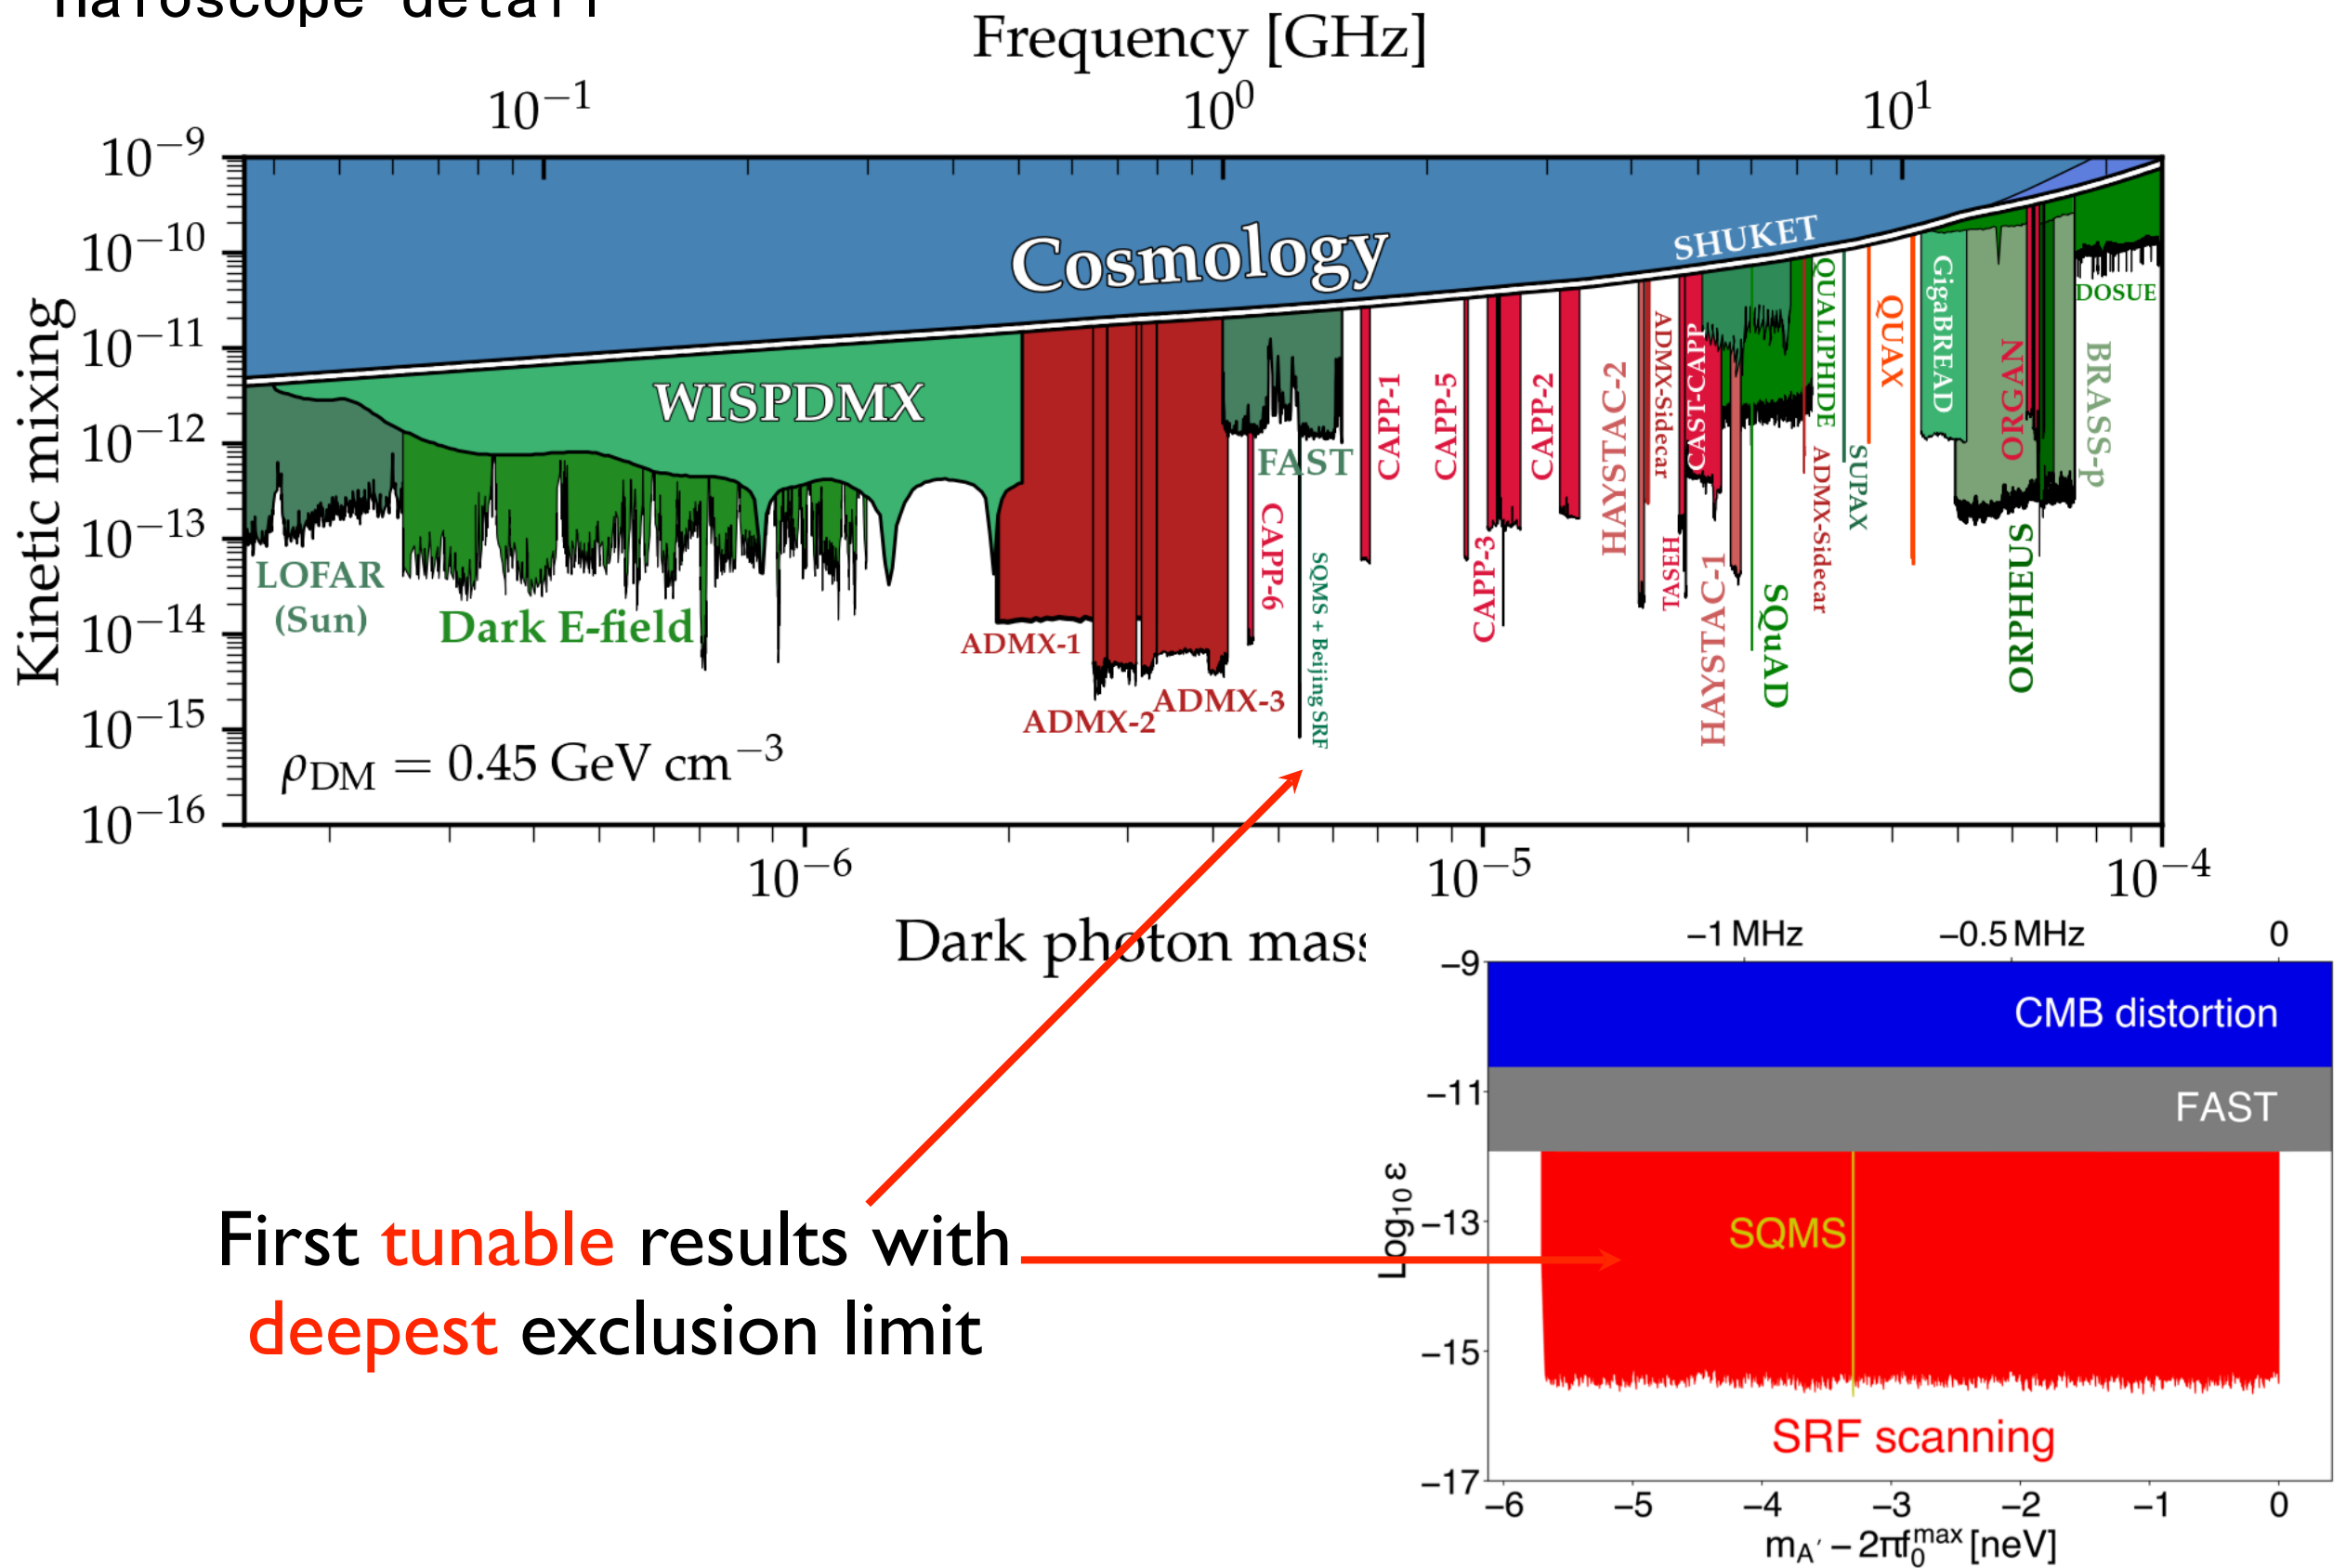

Still a lot of room to detect

how to make use it?
 5 orders more than traditional cavity.

Axion limit webpage: <https://github.com/cajohare/AxionLimits/blob/master/docs/dp.md>

DPDM search

Haloscope detail

First **tunable** results with **deepest** exclusion limit

Spectrum of Ultra-light Dark Matter

The Virial Theorem: the velocity of dark matter near Earth is approximately 10^{-3} boosted by gravity.

$$a(t) = \frac{\sqrt{2\rho_{\text{DM}}}}{m_a} \cos(m_a t + \phi)$$

Frequency: $\omega_a \simeq \text{GHz} \frac{m_a}{10^{-6} \text{ eV}}$

Coherence: $\tau_a \simeq \text{ms} \frac{10^{-6} \text{ eV}}{m_a}$

Max Exp. Size: $\lambda_a \simeq 200 \text{ m} \frac{10^{-6} \text{ eV}}{m_a}$

Axion **DM** as an example, same for other kinds (DPDM, etc)

$$\tau_a \sim 1/m_a \langle v_{\text{DM}}^2 \rangle \sim Q_a/m_a \sim 10^6/m_a$$

Bandwidth of axion DM is 10^{-6}

Detector bandwidth $< 10^{-6}$ accelerate the scan rate

$$\lambda_a \sim 1/m_a \sqrt{\langle v_{\text{DM}}^2 \rangle} \sim 10^3/m_a$$

Momentum width 10^{-3}

A decorative graphic on a blue background. It features a central white rounded rectangle containing the text. SRF Cavity Project for DPDM

SRF Cavity

- ▶ Significant $Q_0 > 10^{10}$ compared to copper cavity with $Q_0 \leq 10^6$.
- ▶ Superconducting Radio-Frequency (SRF) Cavities:
extremely high $Q_0 \simeq 10^{10} \rightarrow$ improve $\text{SNR} \propto Q_0^{1/4}$
- ▶ 1-cell elliptical niobium cavity with **mechanical tuner**, immersed in liquid helium at $T \sim 2\text{ K}$
- ▶ TM_{010} mode: z-aligned \vec{E} , **maximizes the overlap** for dark photon dark matter (DPDM)

$$\epsilon \approx 10^{-16} \left(\frac{10^{10}}{Q_0} \right)^{\frac{1}{4}} \left(\frac{4L}{V} \right)^{\frac{1}{2}} \left(\frac{0.5}{C} \right)^{\frac{1}{2}} \left(\frac{100\text{ s}}{t_{\text{int}}} \right)^{\frac{1}{4}} \left(\frac{1.3\text{ GHz}}{f_0} \right)^{\frac{1}{4}} \left(\frac{T_{\text{amp}}}{3\text{ K}} \right)^{\frac{1}{2}},$$

SRF Cavity Searches for Dark Photon Dark Matter: First Scan Results

Experimental operation

Parameters

	Value	Fractional Uncertainty
$V_{\text{eff}} \equiv V C/3$	693 mL	< 1%
β	0.634 ± 0.014	1.4%
G_{net}	(57.30 ± 0.14) dB	3.1%
Q_L	$(9.092 \pm 0.081) \times 10^9$	/
f_0^{max}	1.2991643795 GHz	/
Δf_0	11.5 Hz	/
t_{int}	100 s	/

microwave electronics for DPDM searches

Step 2: calibration

I-3 connection: calibration by subtracting the line loss to get the total gain G_{net} .

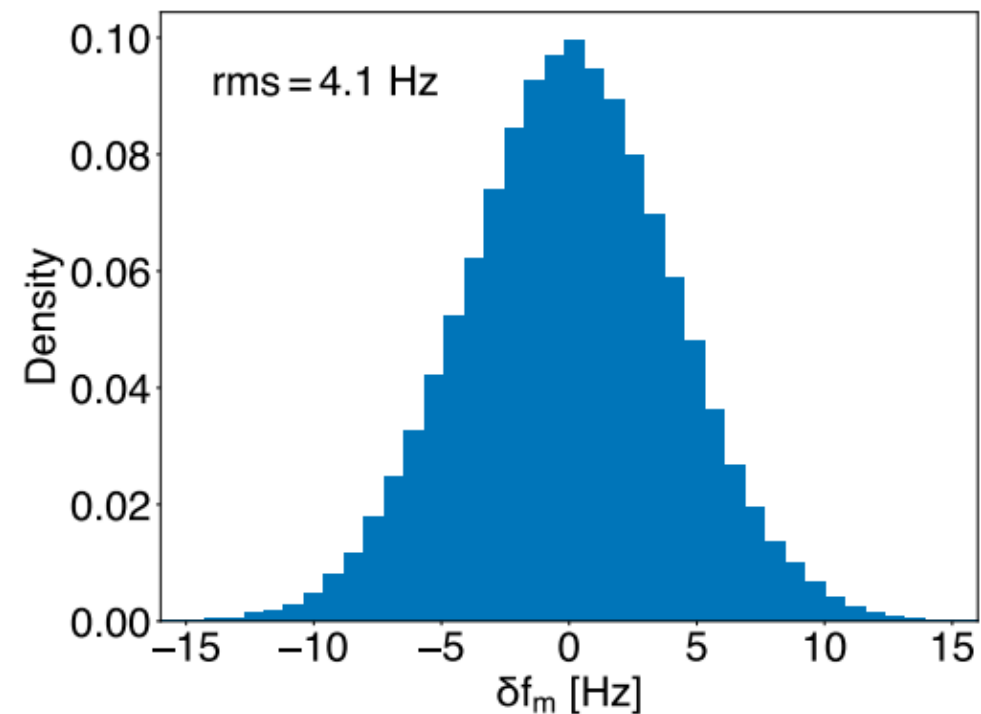

Step 3: Do experiment

2-3 connection: tune the cavity resonant frequency to do the experiment

Scan Search with Mechanical Tuning

- ▶ Mechanical tuner scans resonant frequency f_0 with the step $\sim f_0/Q_{\text{DM}}$
- ▶ Calibrate f_0 and its stability range Δf_0 in each scan
- ▶ Frequency drift $\delta f_d \leq 1.5\text{Hz}$ and microphonics effect $\sigma_{f_0} \approx 4\text{Hz}$

- ▶ **Conservatively** choose $\Delta f_0 \approx 10\text{Hz}$

Data analysis and constraints

- ▶ Total **1150 scan steps** with **each 100s integration time**.
- ▶ **Group every 50 adjacent bins** and perform a **constant fit** to address small helium pressure fluctuation.
- ▶ Normal power excess shows **Gaussian distribution**:

- ▶ **First scan search with SRF and most stringent constraints in most exclusion space.**

Few comment on $Q \gg Q_{\{DM\}}$

simple fit function (constant):
attenuation factor almost 1

different from ADMX

Modulated Signal from Galactic Dark Photons

- ▶ Galactic dark photons from DM decay, e.g.:
cascade decay from DM halo
- ▶ **Vectorial** observable $\propto \vec{A}'$
→ angular-dependent signal $\propto C(\theta)$
→ modulation as the Earth rotates
- ▶ Production is **polarization-dependent**,
modulations for longitude and transverse
modes are **opposite**

SRF Constraints for Galactic Dark Photons

- ▶ **Same dataset** as DPDM search
- ▶ Scanned range within galactic dark photon bandwidth → **combine all scan steps** to analyze
- ▶ **Longitude** mode has **better sensitivity** because of the larger spatial wavefunction $\sim \omega_{A'}/m_{A'}$

preliminary

- ▶ Gradient color region represents exclusions for different DM mass

Surrounding this rectangle are several circles of different colors (orange, green, blue) and sizes, connected by thin white lines, resembling a network or a stylized map.

Summary and outlook

Summary and outlook

- High-Q SRF is extremely interesting in Haloscope wave-like DM searches (get deepest constraints).
- DP backgrounds has rich information (polarization & angular distribution).
- In the future (axion, GWs, quantum qubit, etc), much more can be done . (opening, need more people)

A decorative graphic on a blue background. It features a central white rounded rectangle containing the text "Thank you!". Surrounding this rectangle are several circles of different colors (orange, green, blue) and sizes, connected by white lines, resembling a network or a stylized map. The circles are positioned at the corners and along the sides of the central text box.

Thank you!
